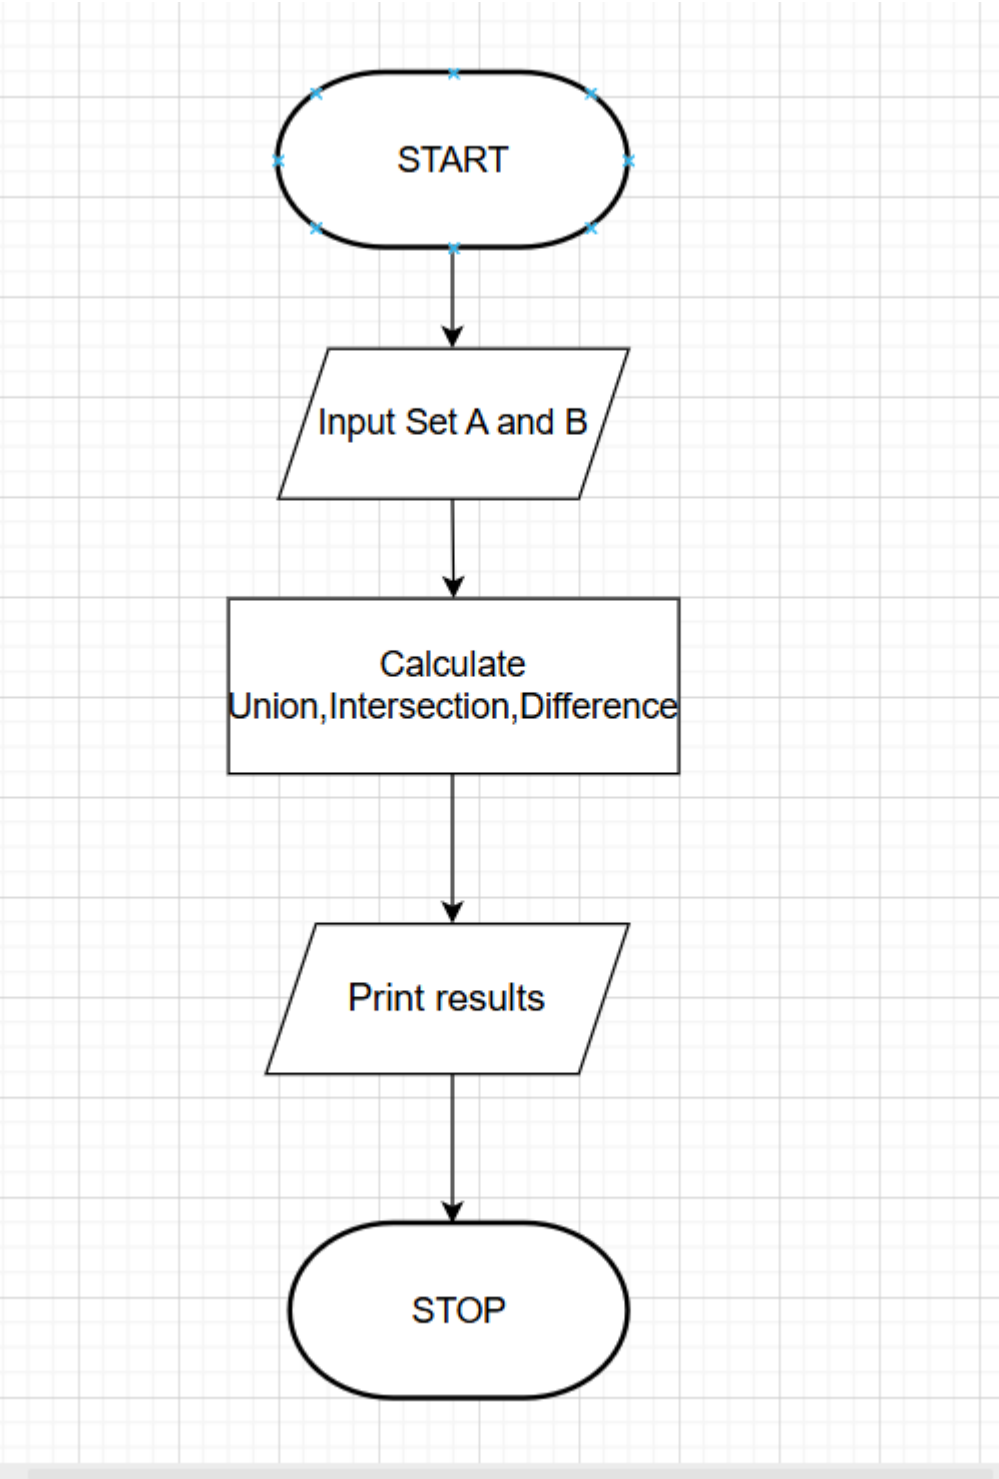
Aim 5.1.2 Write a program to calculate the total marks, aggregate percentage, and grade of a student based on marks in four subjects. The grade is determined as follows:

- Aggregate > 75%: Distinction
- Aggregate >= 60% and < 75%: First Division
- Aggregate >= 50% and 60%: < Second Division
- Aggregate >= 40% and 50%: < Third Division
- Aggregate < 40%: Fail

Algorithm-

Step 1: Start
Step 2: Input set A
Step 3: Input set B
Step 4: Find union of A and B
Union = A ∪ B
Step 5: Find intersection of A and B
Intersection = A ∩ B
Step 6: Find difference of A and B
Difference = A − B
Step 7: Display union, intersection, and difference
Step 8: Stop

Flowchart-



START
Input Set A and B
Calculate
Union,Intersection,Difference
Print results
STOP

CODE-

Debugger

```python
marks = list(map(int, input().split()))
total_marks = sum(marks)
aggregate_percentage = (total_marks / 400) * 100

if aggregate_percentage >= 75:
    grade = "Distinction"
elif 60 <= aggregate_percentage < 75:
    grade = "First Division"
elif 50 <= aggregate_percentage < 60:
    grade = "Second Division"
elif 40 <= aggregate_percentage < 50:
    grade = "Third Division"
else:
    grade = "Fail"
print(total_marks)
print(f"{aggregate_percentage:.2f}")
print(grade)
```
